MINIMIZE COST TO GET THE PARAMETERS (BOUNDARY LINE OR LINEAR REGRESSION) THEN MINIMIZE THE LANDMARKS TO GET THE FUNCTION AND CONTOUR MAP WITH THE LEAST REGULARIZATION OR THE LEAST PENALTY

Example:

$$l^{(1)} = \begin{bmatrix} 3 \\ 5 \end{bmatrix}, \quad f_1 = \exp\left(-\frac{\|x - l^{(1)}\|^2}{2\sigma^2}\right)$$

$$\sigma^2 = 1 \qquad\qquad \sigma^2 = 0.5$$

$$X = \begin{bmatrix} 3 \\ 5 \end{bmatrix}$$

≈ 0

kernel looks similar, except for the

10:12 / 15:44
